AutoCAD was designed to provide a single comprehensive solution for all 2D drafting and 3D modeling needs of designers, contractors, and industry professionals. This includes 2D drafting, 2D drawing, and 3D modeling, as well as both technical and general drafting. Using a feature called "interactive dimensioning," AutoCAD can also generate 2D DWG drawing files, as well as Inventor files, and other file types. Prior to the introduction of AutoCAD, CAD was a specialized discipline. While a computer did the computation, CAD required one operator to make 2D drawings, and a second operator to connect 2D drawings with the model using "dimensions" (linear distances). As the industry transitioned to

the use of computers in the design process, software solutions were necessary to adapt 2D drafting and 3D modeling to a software environment, and to allow one person to do the drafting, while another person could model. AutoCAD was the first general-purpose software solution for CAD. AutoCAD was originally developed as a solution for architectural and engineering design, but was marketed to meet the needs of a broader user base. Today, AutoCAD is widely used by industrial designers, architectural designers, mechanical designers, mechanical and electrical engineers, civil engineers, interior designers, and other designers. AutoCAD is also used by contractors, and for producing 3D models for a variety of design, construction, and architectural uses. While there are many kinds of products that can be modeled with AutoCAD, the two most common categories are architectural and mechanical. Other categories include land use, manufacturing, product design, sales and marketing, and more. As CAD software tools have advanced, AutoCAD has evolved and grown to support a variety of new and evolving standards and techniques. Today, AutoCAD is the most popular CAD application for a wide variety of users, with over 2.5 million licenses. While most users of AutoCAD are familiar with this

desktop application, AutoCAD is also available in several mobile and web applications, which allow users to design and make 2D drawings and 3D models on a mobile device, from anywhere, at any time. A recent survey of AEC professionals revealed that AutoCAD is the most widely used CAD application. A survey of AEC professionals by BPS Intelligence in May 2017 showed that 98% of CAD users currently work in the field of Architecture, Engineering, Construction, or
